

GLOSSARY OF TERMS

Term	Definition
Agency	The capacity of a consciousness to actively modulate frequency and intentionally select which frozen moments to illuminate.
Attractor Basin	A region of the configuration space defined by a frequency attractor. Consciousness vectors within a basin are drawn to frequency-compatible frozen moments.
Basin Overlap	The region where two or more attractor basins intersect, creating the perception of shared physical reality.
Biological Receiver	The physical body and brain. An access terminal to the quantum information repository (the soul). The brain is a router, not a hard drive. <i>Note: The model is substrate-agnostic—any physical system capable of phase-locking with consciousness could serve as a receiver.</i>
Bleed-Over	Incomplete decoherence between adjacent consciousness vectors ($\Delta\Omega \approx 0$), resulting in non-zero entanglement entropy and leakage of low-amplitude informational states. Perceived as synchronicities, shared thoughts, or peripheral anomalies.
Bleed-Through	Transient quantum entanglement between previously orthogonal consciousness vectors during rapid, extreme frequency shifts (e.g., NDEs). Allows high-fidelity transfer of informational states across vectors.

Cloud	A colloquial term for the soul. The quantum information repository is not separate from the soul—it is the soul's own structure. Memories and experiences are integrated into the soul as ordered quanta (garbons).
Consciousness	A projection of the soul into a specific frozen moment or sequence of frozen moments. It is the active, experiencing portion of the soul. The navigator.
Consciousness Vector	A directed sequence of frozen moments illuminated by a given consciousness. It is the path of experience. The sequential illumination of these frozen moments is the experience of time. Time is not a separate dimension—it is the trajectory of the vector itself.
Dimensional Anchor	An individual whose frequency coherence is intentionally amplified to influence group vector coherence. The anchor's frequency alignment acts as a "magnet" for adjacent consciousness vectors.
Double-Tap Effect	Two simultaneous forces that make escape from a frequency basin difficult: internal frequency alignment (first tap) and external shadow frequencies (second tap).
Duty Cycle	The proportion of time consciousness spends in the physical state versus the non-physical state. For humans, approximately 50%.
Fated Life	A life in which the consciousness vector follows the path of least resistance—the pre-birth template and surrounding frequency basin—without active modulation.
	The biological receiver's mechanism for

Filter	maintaining a stable, coherent rendering of reality by selectively translating frequency input into sensory experience.
Frequency (Ω)	The specific eigenvalue of the consciousness operator, dictating the probability distribution of the vector's attention within the configuration space. Proxied via EEG/MEG phase coherence, microtubule resonance, or Kuramoto order parameters.
Frequency Attractor	A region of the configuration space with a high density of frequency-compatible frozen moments. A stable basin that draws consciousness vectors toward it.
Frequency Basin	A region of the configuration space defined by a frequency attractor. Consciousness vectors within a basin are drawn to frequency-compatible frozen moments.
Frequency Basin Inertia	The resistance a consciousness vector experiences when attempting to escape a frequency basin, caused by internal frequency alignment and external shadow frequencies.
Frequency Synchronization	The alignment of consciousness frequency with biological receiver frequency. This is the operational mechanism of reality navigation.
Frozen Moments	Static quantum configurations that constitute all possible states of reality. They do not change—they simply are.
Garbons	Ordered quantum structures that form naturally from quanta through entropic resonance—the tendency of similar frequencies to align. Garbons are the structural components of souls. They exist

prior to consciousness. Consciousness can also generate new garbons through thought, memory, and experience.

Memory-Garbon

A garbon that preserves the structure of a past experience, learned pattern, or navigational outcome. It is passive, past-oriented, and provides continuity and context for the consciousness vector. Memory-garbons are stored in the soul and accessed through the biological receiver. Each consciousness vector retains its own unique memory set, recorded as memory-garbons within the soul.

Thought-Garbon

A garbon generated in the present moment through intentional focus, attention, and intention. It is active, present-oriented, and serves as the engine of navigation. Thought-garbons modulate frequency, altering the trajectory of the consciousness vector.

Group Vector

The collective trajectory of a cluster of frequency-compatible consciousness vectors.

Group Vector Shift

A collective movement of a cluster of consciousness vectors from one attractor basin to another.

Heaven/Nirvana

The experience of being in a frequency-compatible non-physical cluster. Not a place—a state of frequency alignment.

Mandela Effect

A phenomenon in which large groups of people share detailed, vivid memories of events, logos, quotes, or historical facts that do not align with the current frozen moment. A consequence of group vector coherence.

The boundary condition where the

Orthogonality Limit	The boundary condition where the frequency delta ($\Delta\Omega$) between two consciousness vectors exceeds a specific threshold (T), resulting in total decoherence and impossibility of bleed-over or bleed-through.
Quantum Information Repository	The non-local, non-temporal substrate in which all frozen moments and memory states exist. The "cloud"—the soul.
Quantum Shadows	Projections of other consciousnesses into a given consciousness's vector. They appear to interact but are not actual co-occupants.
Quanta	The fundamental building blocks of reality. The smallest units of quantum information. They naturally organize into patterns.
Reality Machine	The conceptualization of reality as a mechanism designed for soul growth. Consciousness navigates reality to generate experiences; experiences are consolidated into memory-garbons; memory-garbons expand the soul's complexity, coherence, and density.
Router/Cloud Architecture	A conceptual framework where the brain is a receiver (router) of memory and experience from the quantum information repository (the soul).
Self-Navigated Life	A life in which the consciousness vector actively modulates frequency, intentionally selects frozen moments, and exercises agency to shape its trajectory.
Shift in Frequency ($\Delta\Omega$)	A unitary transformation of the consciousness vector's state, driven by the application of thought (directed attentional weight). Measured as a change in phase coherence.

Sine Wave Navigation

The oscillatory pattern of consciousness movement through the configuration space, alternating between physical (particle) and non-physical (wave) states.

Soul

A complex, organized collection of garbons that has achieved sentience and agency through critical complexity and coherence. The soul is the quantum information repository (the "cloud"). It is eternal and persists across multiple consciousness projections. Consciousness emerges from the soul. The soul's construction is shaped by the experiences of its consciousness vectors. Different experiences result in different garbon configurations, and thus different memories. Each consciousness vector retains its own unique memory set, recorded as memory-garbons within the soul. The purpose of reality navigation is to grow the soul by generating new garbons.

Symbolic Coordinates

Mental images or phrases used as symbols for desired outcomes. They generate frequency profiles that match the symbols, not the substance, leading to inaccurate navigation.

Thought

The singular ability of consciousness. A frequency modulator that alters the consciousness vector. Generates thought-garbons.

Traveler

A consciousness vector that has intentionally shifted its frequency to navigate to a different region of the configuration space.
